Production Server Backup & Restore Manual

PRODUCTION **Project:** Jishnu Infotech Support (`jit_support`) • **Server:** Bluehost VPS (`129.121.128.205`) • **Panel:** Easypanel

1. Server & Environment Reference

Item	Configuration
Easypanel Dashboard	`http://129.121.128.205:3000`
Project Name	`jit_support`
PostgreSQL Database Service	`jit` (Database: `$POSTGRES_DB` / User: `$POSTGRES_USER`)
Application Service	`github` (Node.js Express / Vite)
Attachments Directory	`/app/data/attachments` (Inside `github` service container)

2. Step-by-Step: Database Backup (From Server to Local PC)

Step 1: Open Database Web Terminal

1. Log in to Easypanel at `http://129.121.128.205:3000`
2. Click on project **jit_support** → click service **jit** (Postgres)
3. Click **Console** (or **Terminal**) in the top tabs → click **Bash**
4. You will see the root prompt: `root@...:/#`

Step 2: Generate Compressed PostgreSQL Dump

Run this command inside the terminal prompt:

```
pg_dump -U $POSTGRES_USER $POSTGRES_DB | gzip > /tmp/db_backup.sql.gz && echo "Backup read
y!"
```

Note: Uses the container's built-in `$POSTGRES_USER` and `$POSTGRES_DB` environment variables automatically.

Step 3: Upload Backup to Secure Transfer Endpoint

Send the backup to the temporary transfer service:

```
curl -F "file=@/tmp/db_backup.sql.gz" https://tmpfiles.org/api/v1/upload
```

The server returns JSON output like:

```
{"status":"success","data":{"url":"https://tmpfiles.org/XXXXXX/db_backup.sql.gz"}}
```

Step 4: Download the File to Your Windows System

1. Take the URL returned in Step 3.
2. Insert `/dl/` immediately after `tmpfiles.org`:
   - **Original link:** `https://tmpfiles.org/XXXXXX/db_backup.sql.gz`
   - **Direct download link:** `https://tmpfiles.org/dl/XXXXXX/db_backup.sql.gz`
3. Paste the direct download link into Chrome or Edge. The file will save directly to your **Downloads** folder.

Step 5: Clean Up the Server

In the terminal, remove the temporary backup file:

```
rm /tmp/db_backup.sql.gz
```

3. Extracting and Verifying the Backup on Windows

Your downloaded file is compressed with gzip (`db_backup.sql.gz`).

Option A: Extract using 7-Zip / WinRAR

- Right-click `db_backup.sql.gz` → **7-Zip** → **Extract Here**.
- It will produce the raw `db_backup.sql` file.

Option B: Extract using Windows PowerShell

```
$in = "$HOME\Downloads\db_backup.sql.gz"
$out = "$HOME\Downloads\db_backup.sql"
$src = [System.IO.File]::OpenRead($in)
$dst = [System.IO.File]::Create($out)
$gz = New-Object System.IO.Compression.GZipStream($src, [System.IO.Compression.CompressionM
ode]::Decompress)
$gz.CopyTo($dst)
$gz.Dispose(); $dst.Dispose(); $src.Dispose()
Write-Host "Extracted successfully to $out"
```

4. Step-by-Step: Backing Up File Attachments & Manuals

1. In Easypanel, open project **jit_support** → click service **github** (App container).
2. Click **Console** → **Bash**.
3. Archive all ticket attachments and uploaded manuals:

   ```
   tar -czf /tmp/attachments_backup.tar.gz -C /app/data attachments
   ```

4. Upload and download:

   ```
   curl -F "file=@/tmp/attachments_backup.tar.gz" https://tmpfiles.org/api/v1/upload
   ```

5. Add `/dl/` to the download URL and save to your PC.
6. Clean up:

   ```
   rm /tmp/attachments_backup.tar.gz
   ```

5. Disaster Recovery / Restoring the Database

To restore your database dump into PostgreSQL:

1. In Easypanel → **jit** service → **Console** → **Bash**.
2. If restoring from `.sql.gz`:

```
gunzip -c /tmp/db_backup.sql.gz | psql -U $POSTGRES_USER -d $POSTGRES_DB
```

3. If restoring from uncompressed `.sql`:

```
psql -U $POSTGRES_USER -d $POSTGRES_DB < /tmp/db_backup.sql
```

4. Verify table count and restoration:

```
psql -U $POSTGRES_USER -d $POSTGRES_DB -c "\dt"
```

6. Quick Troubleshooting

Error / Symptom	Root Cause	Solution
`curl: command not found`	Curl is missing from container	Run `apt-get update && apt-get install -y curl` once.
`role "postgres" does not exist`	Using hardcoded default user	Always use `$POSTGRES_USER` variable in the command.
`pg_dump: command not found`	Terminal opened in app container	Switch console to the **jit** (Postgres) service.
Browser downloads HTML page instead of file	Missing direct download prefix	Add `/dl/` after `tmpfiles.org` in the link.
